What I Learned

Our eyes and brain work together to see the world. Sometimes they make mistakes! When your brain guesses wrong about what you're seeing, that's called an **optical illusion**.

Key Idea: Your brain doesn't just see—it interprets. It fills in gaps, makes assumptions, and sometimes gets tricked!

Activity 1: Observe an Illusion

Look at the optical illusion your teacher shows you. Draw what you see below:

Draw the illusion here

Answer these questions:

What did you see at first?

Did you see something different when you looked again?

Why do you think your brain saw it that way?

Activity 2: Create Your Own Simple Illusion

Try making your own optical illusion! Here are some easy ideas:

- Draw a picture that looks like two different things (like the duck/rabbit)
- Draw lines that look bent but are actually straight
- Draw two shapes that look different sizes but are actually the same

Create your illusion here

Explain your illusion: What trick does it play on the eyes?

Share with Your Family!

Show your family an optical illusion from class or one you find online. Ask them: "What do you see?" See if they see it differently than you do!
