TEACHING GUIDE

# Optical Illusions & Visual Deception

A comprehensive guide for educators using the Mini Museum exhibition to teach critical thinking, media literacy, and the science of perception.

## OVERVIEW

This exhibition explores how our brains process visual information—and how easily that processing can be manipulated. From Victorian-era optical toys to modern deepfakes, students discover that "seeing is believing" has never been entirely true.

## LEARNING OBJECTIVES

### Students will:

- understand that visual perception is a construction of the brain, not a direct recording of reality;
- recognize that visual deception has existed throughout history;
- develop strategies for verifying visual information; and
- connect scientific understanding of perception to ethical responsibility for truth.

## PRE-VISIT ACTIVITIES

### Before the visit

#### 01

#### The Blind Spot Discovery · 5 minutes

Have students find their blind spot: Draw a small X and a dot about 6 inches apart on paper. Close your right eye, hold paper at arm's length, focus on the X with your left eye, and slowly move the paper closer. The dot will disappear! This demonstrates that our brains fill in gaps we don't notice.

**Interactive version:** michaelbach.de/ot/cog-blindSpot/

#### 02

#### The Perception Lab · 10–15 minutes

Before or after the visit, have students explore the Mini Museum's interactive Perception Lab featuring 23 optical and color illusions.

**Works on any device:**
minimuseumproject.org/exhibitions/seeing-is-deceiving/illusions

#### 03

#### The Scrambled Sentence Challenge · 5 minutes

Show students: "Yuor barin can raed tihs scntenee eevn wehn the wrods are srcambled." Most can read it easily. Discuss how brains predict what should be there based on context.

#### 04

#### Current Events Discussion · 10–15 minutes

Ask: "Have you ever seen a photo or video online that later turned out to be fake?" Introduce the concept that technology now allows anyone to create realistic-looking images of things that never happened.

DURING THE VISIT

## Guided questions for students

### AT POSTER 1 · SCIENCE OF HOW WE SEE

- "Why might your brain show you something that isn't there?"
- "If color looks different depending on context, how might this apply to judging people?"

### AT POSTER 2 · HISTORY OF VISUAL DECEPTION

- "Why did spirit photography work for 60 years?"
- "What's similar between Victorian spirit photos and modern deepfakes?"

### ARTIFACT INTERACTION

Encourage students to:

- use the stereoscope to experience how the brain creates depth;
- examine Victorian illusion cards to see how one image can be seen two ways;
- test color illusion cards to see identical colors appear different; and
- practice identifying deepfake indicators with the AI video example.

POST-VISIT ACTIVITIES

## After the visit

| | |
|---|---|
| **Middle School** | **"Real or Fake?" Analysis Project.** Provide 5 images/videos (mix of real and manipulated). Groups identify whether each is real or fake, explain reasoning, research to verify, and present findings. |
| **Elementary** | **"My Brain Tricks Me" Journal.** For one week, students note times when they assumed something wrong about a person, thought they saw something that wasn't quite right, or believed something that proved incorrect. |
| **High School** | **Deepfake Ethics Debate.** Debate topics: Should deepfake technology be banned? Who is responsible when a deepfake causes harm? Are entertainment deepfakes different from deceptive ones? |

CROSS-CURRICULAR CONNECTIONS

## One exhibition, six subjects

### Science

- **Biology:** How the eye works, rods/cones, optic nerve
- **Neuroscience:** Brain prediction, pattern recognition
- **Physics:** Light, reflection, lenses

### History

- Victorian era entertainment and technology
- History of photography and cinema
- Propaganda use in WWI and WWII

### Technology

- How AI generates images and video
- Digital forensics and verification tools
- Future of synthetic media

### Ethics / Religion

- Eighth Commandment: bearing true witness
- Responsibility to seek truth
- Digital citizenship and integrity

### English / Language Arts

- Evaluating source credibility
- Distinguishing fact from opinion
- Analyzing perspective and bias

### Social Studies

- Media literacy in democracy
- Visual media's influence on opinion
- Current misinformation challenges

ASSESSMENT IDEAS

## Checking for understanding

### FORMATIVE ASSESSMENT

- **Exit Ticket:** "Name one thing that surprised you about how your brain sees things."
- **Think-Pair-Share:** "How might understanding optical illusions help you in real life?"
- **Quick Write:** "Describe a time you should have verified something before believing it."

### SUMMATIVE ASSESSMENT OPTIONS

- **Research Project:** Investigate a historical example of visual deception
- **PSA Creation:** Design a public service announcement teaching peers to spot fake images
- **Critical Analysis Essay:** Evaluate visual media's role in a current event
- **Presentation:** Explain how a specific optical illusion works scientifically

EXTENDED RESOURCES

## Recommended reading for teachers

KEY TAKEAWAY FOR STUDENTS

Your brain is remarkably powerful, but it takes shortcuts that can deceive you. In friendships, news, social media, and every aspect of life—pause before judging. Get the full picture. Verify before believing. Critical thinking isn't just a school skill; it's a life skill.
